Module Aims أهداف المادة الدر اسية	fundamentals of derivatives and integrals and their a these concepts in science and engineering fields.				
Module Learning Outcomes مخرجات التعلم للمادة الدر اسية	 Calculate limits, derivatives, and indefinite in and trigonometric functions of a single variate. Apply the definition of continuity to pure problems. Utilize the definition of the derivative to differential calculates and trigonometric functions of a single variate. Use the properties of limits and the derivative various functions of a single variable including. Employ the principles of the differential calculates problems, related rates exercises, and other and Calculate the area of regions in the plane with. Utilize the Fundamental Theorem of Calculates and the volume and surface area of solid 	ole. e and applied manual ferentiate various ble. vative to analyze and transcendental leulus to solve opplications. n elementary Riemulus and the tecolate the area of regularity and the tecolate the area of regularity and the secolate the area of regularity and the second area of the second area o	as algebraic e graphs of functions. ptimization mann sums. chniques of gions in the		
Indicative Contents المحتويات الإرشادية	Indicative content includes the following. • Precalculus and functions (8 hrs) • Limits and continuity (14 hrs) • Derivatives and their applications (16 hrs) • Integral and its applications (16 hrs) • Transcendental Functions, First order differential equation (16 hrs)				
Course Description	This course covers topics of differential and integral of continuity, higher-order derivatives, curve sketching indefinite integrals (areas and volumes), and applintegrals. In addition, students review and extrigonometry and basic analytic geometry. Importar sequence are to develop and strengthen the students to teach them to read, write, speak, and think in the liparticular, students learn how to apply the tools of calculations.	g, differentials, dications of derivatend their known to objectives of the problem-solving language of math	lefinite and vatives and wledge of he calculus g skills and ematics. In		

Learning and Teaching Strategies استراتیجیات التعلم والتعلیم The learning and teaching strategy is designed to: Carefully cover in lectures the necessary fundamental material and analytical techniques, and demonstrate concepts with appropriate (and where possible practical) examples Allow students adequate time to practice the techniques using a large number of

carefully selected tutorial problems.

Module Aims, Learning Outcomes, Indicative Contents and Brief Description									
ختصر	أهداف المادة الدراسية ونتائج التعلم والمحتويات الإرشادية مع وصف مختصر								
Module Aims أهداف المادة الدر اسية	possessing critical thinking skills to assess ideas, acquiring	Develop the ability/skill needed to discover/innovate/create, as demonstrated by students possessing critical thinking skills to assess ideas, acquiring research skills, synthesizing knowledge across disciplines or applying academic knowledge to self-life problems.							
Module Learning Outcomes مخرجات التعلم للمادة الدراسية	 Identify various reading skills and apply them in reading, referencing and summarizing literature on engineering Identify various skills of technical presentation and apply them in conducting short technical presentations based on information extracted from readings Identify technical discussion skills and apply these in planning and conducting simulated technical discussions characteristic of those that go on in engineering contexts. Identify and compare the structures and language characteristics of various types of written study and workplace reports characteristic of those produced by engineering students and practicing engineers (e.g., incident reports and progress reports) mainly, and applying this knowledge in writing one of the latter Develop communication skills through active participation in class and group activities. 								
Indicative Contents المحتويات الإرشادية	 Indicative content includes the following. Technical presentations (5 hrs) Conducting technical discussions about engineering projects (5 hrs) Writing technical documents (5 hrs) Writing business correspondence (5 hrs) 								
Course Description	This course is designed to provide engineering students with the necessary oral and written skills required for effective communication in academic and workplace contexts, both with experts in their field and lay persons. It begins by introducing them to the principles of good academic practice, which are also presented as a model for ethical workplace practice, and thus help them to avoid issues such as plagiarism. The main part then leads on to developing research and summarizing skills that form the basis for the later activities. Students next learn to apply these skills to conducting technical presentations, as well as in group discussions that culminate in project planning activities.								
	Learning and Teaching Strategies								
	استراتيجيات التعلم والتعليم								
Strategies	The learning and teaching strategy is designed lectures the necessary fundamental material and demonstrate concepts with appropriate (and examples Allow students adequate time to pract large number of carefully selected tutorial problems.	analytical techn where possible ice the techniqu	iques, and practical)

Week 4	Handling the Accidental Release of Hazardous Materials. Notifications, Spill Containment and Clean-up. Leaking Gas Cylinders, Fires Classification, Fire Extinguishers (how they work, types), Risk Assessment			
Week 5	Case Study University of Texas Austin Sodium Fire (Lessons Learned). The New Safety Data Sheets (SDS) versus the Old Material Safety Data Sheets (MSDS)			
Week 6	Assessment of Chemical Toxicity, Toxic Hazards (Dose, Risk Assessment, Types of Toxins, Flammable Hazards, Flammability Characteristics, Flammability Classes, Causes of Ignition, Reactive Hazards, Explosives			
Week 7	Midterm exam			
Week 8	Case Study University of Wisconsin – LiAlH4 Explosion (Lessons Learned). Ordering and Receiving Chemicals			
Week 9	Regulatory Compliance – History of Occupational Safety and Environmental Laws. General Considerations (Chemical Segregation, Transfer and Transport, Chemical Fume Hoods (Safety, Types, Operation), Other Types of Ventilation)			

Week 10	Working with Highly Toxic Compounds (General Considerations, Planning, Precautions for Minimizing Exposure – Handling, In the Event of a Spill). Case Study DuPont Facility – Phosgene Release (Lesson Learned)
Week 11	Managing and Working with Chemicals. Working with Flammable Substances (Standard Operating Procedures). Working with Highly Reactive or Explosive Substances
Week 12	Working with Compressed Gases (Parts of the Cylinder, Cylinder Pressure Regulator, Storage Guidelines, Transporting Cylinders, Handling Compressed Gas Cylinders)
Week 13	Working with Cryogenics (Health Hazards, Liquid N2), Waste Handling, Characterization of Waste
Week 14	Working with Water (liquid)-dependent Equipment (Hazards, Proper Use, Heating Baths) Working with High Pressure/Vacuum. Working with Vacuum Pump. Working with Stirring and Mixing Devices. Working with Heating Devices (Variacs, Oil, Salt, Sand Baths, Microwave Ovens. Ultrasonicators and Centrifuges and HPLCs
Week 15	Biosafety, Radiation, and Animals I. Radiation. Chemicals such as acrylamide & ethidium bromide. Pathogens. Biological waste handling. Recombinant DNA. Mammalian cell culture. Case Study. Hazards of nanoparticles. Preventative Measures. Disposal
Week 16	Final Exam

Learning and Teaching Resources					
مصادر التعلم والتدريس					
	Text	Available in the Library?			
Required Texts	Hill, Robert H, Jr. and David C. Finster, Laboratory Safety for Chemistry Students, Wiley, Hoboken, 2010. This is a comprehensive text that partitions safety considerations into three tiers, with increasingly more involved considerations being reflective of increased knowledge by students. Emphasis is on learning on a "need to know basis.	No			
Recommended Texts	Guidelines for Chemical Laboratory Safety in Academic Institutions, ACS Committee on Chemical Safety, Washington, DC., 2016. A comprehensive document providing a broad overview of the range of safety considerations for undergraduate, graduate and continuing safety education.	No

	arning Outcomes, Indicative Contents and Brief Description					
أهداف المادة الدراسية ونتائج التعلم والمحتويات الإرشادية مع وصف مختصر						
Module Aims أهداف المادة الدر اسية	Enable students to understanding and Knowledge of the principle of analytical chemistry and understand the procedures and applications of chemical reactions. In depth study of analytical chemistry for a wide range of chemical reactions. Introducing students to instrumental techniques and modern devices used in the instrumental analysis laboratory by studying the details of the devices' work and conducting practical experiments. Work to enhance the student's confidence and ability to deal with chemicals and laboratory equipment.					
Module Learning Outcomes مخرجات التعلم للمادة الدراسية	 Enable students to know the basic concepts of analytical chemistry. Enabling students to know the types of chemical analysis (gravimetric and volumetric analysis). Enable students to know chemical calculations and chemical equilibrium. Enabling students to know the Titration methods and chemical indicators. Enabling students to know what is the Acid – Base equilibrium and what is the pH solution. Enable students to know solubility, solubility product constant, precipitation reactions, and molecular precipitation. Understand the nature of electromagnetic radiation and its effect on matter. Understand the procedures and applications of analytical techniques. Understand the principles of spectroscopic methods. 					
Indicative Contents المحتويات الإرشادية	Indicative content includes the following. The theoretical part Principles of gravimetric analysis(4 hrs) Principles of Volumetric analysis(4 hrs) Acid – Base Equilibria and pH of solutions(4 hrs) Titration curves and chemistry of indicators(5 hrs) Buffer solutions(3 hrs) Solubility Product (5 hrs) Electromagnetic radiation and its effect on matter (6 hrs) principle of UV - Visible Spectroscopy (6 hrs) The principle of HPLC & GC (8 hrs) Practical part Fifteen practical experiments, two hours for each practical experiment. (30 hrs)					
Course Description	This course aims to know and understand the principle of analytical chemistry and understand the procedures and applications of chemical reactions and analysis of substances through the use of automated analytical equipment prepared for this purpose. An in-depth study of analytical					

chemistry for a wide rar	nge of chemical reactions and their development
through laboratory exper	riments, developing skills in titrimetry, volumetric
and gravimetric analysis,	and instrumental analysis.

Learning and Teaching Strategies

أهداف المادة الدراسية ونتائج التعلم والمحتويات الإرشادية مع وصف مختصر										
Module Aims أهداف المادة الدراسية		The aim of this module is to provide students with a comprehensive understanding of the key concepts and principles of computer science. Through the study of topics such as history, data representation, computer components, algorithms, programming languages, operating systems, applications, internet and networking, and cybersecurity, students will gain a broad understanding of the field of computer science and how it has evolved over time.								
Module Learning Outcomes	مخرجان	 Describe the historical development of computer science and its impact on society. Understand the various methods of data representation and manipulation. Identify the components of a computer and their functions. Design and implement algorithms for a range of problems. Understand the principles of programming languages and apply them to develop software. Understand the structure and functions of operating systems. Identify and analyze a range of applications of computer science. Understand the principles of internet and networking technologies. Identify and analyze various cybersecurity threats and methods of prevention. 								
Indicative Cont عتويات الإرشادية		 History introduction: Evolution of computer science, pioneers and important milestones Data representation: Binary numbers, hexadecimal, character sets, ASCII and Unicode 								

	- Computer components: CPU, memory, input/output devices, storage devices					
	- Algorithms: Definition, representation, complexity, searching, sorting, optimization					
	- Programming languages: Syntax, semantics, variables, functions, control structures, abstraction					
	- Operating systems: Structure, file systems, process management, memory management					
	- Applications: Databases, artificial intelligence, computer graphics, human-computer interaction					
	- Internet and networking: Protocols, network architectures, security, privacy					
	- Cybersecurity: Threats, attacks, prevention, detection, mitigation					
Course Description	This course offers students a comprehensive exploration of the fundamental concepts and principles that underpin the field of computer science. By delving into various subjects including the historical development of computing, data representation, computer components, algorithms, programming languages, operating systems, applications, internet and networking, and cyber-security, students will develop a well-rounded understanding of the discipline. By examining the evolution of computer science over time, students will acquire a broad perspective on the field and its significance in contemporary society. Through a combination of theoretical knowledge and practical applications, this module equips students with the necessary foundation to pursue further studies or careers in computer science.					
Learning and Teaching Strategies						
استراتيجيات التعلم والتعليم						
	The module will use a range of learning and teaching strategies, including:					
Strategies	- Lectures : To provide students with an overview of the main concepts and principles.					
	- Labs : To provide students with hands-on experience of programming, algorithms, and data representation.					

- **Assignments and Quizzes**: To provide students with opportunities to apply their knowledge and skills to real-world problems and check their understanding.

Module Aims أهداف المادة الدر اسية	This subject presents a comprehensive methodology that solves material balance problems. Through describe a strategy of analysis, understand and memorize the steps to improve student capabilities. Also, enhance understanding stoichiometric problems.							
Module Learning Outcomes مخرجات التعلم للمادة الدراسية	 An ability to understand the concept of chemical reaction, and demonstrates the types of processes. An ability to provide guidelines so that call in solving material balance problems. An ability to determine the stoichiometric products in moles or mass given the chem An ability to understand the meanings of analysis, dry basis, wet basis, theoretical are (oxygen), and employ these concepts in confidence in dustry also how material balances are used. 	ir application in be efficient an quantities of reaction. If stack gas, flue air (oxygen) and ombustion probless, and a purge	d effective ctants and gas, Orsat excess air ems.					
Indicative Contents المحتويات الإرشادية	 Indicative content includes the following. Introduction to the concept of material balareaction and demonstrates stoichiometric or products. Define excess and limiting reactant. Identify and understand the extent of a reaction calculate the fraction or percent excess reactathe yield. Assignment1 (week 2&3 / 8 hr). Apply 10-step strategy to solve problems with 	lances with cher quantities of react t.(week 1 /4 hr). on in a reaction, ant, percent conve	ants and and ersion and					

	 (week 4 / 4 hr) Formulate and solve material balances using species and element balances. Assignment2. Quiz2. (week 5&6 / 8 hr) Midterm exam and Seminars 1 (week 7 / 4 hr)
	 Material Balances Involving Combustion. Understand the meanings of stack gas, flue gas, orsat analysis, dry basis, wet basis, theoretical air and excess air. Material balances for multiple units with reaction occurs. Assignment3 (week 8,9 &10 /12 hr)
	 Industrial application of material balance. Recycle without Chemical Reaction. Utilize terminology extent of reaction, overall conversion and single pass conversion in solving recycle problems involving reactors. Assignment4. Quiz3. (week 11 &12 / 8 hr)
	 Explain the purpose and Calculations of a bypass and purge stream. Quiz4. (week 13&14 / 8hr)
	Case study material balances in industry. Seminar2 (week 15 / 4hr)
Course Description	This subject builds a strong foundation for the professional development of its students via deep understanding the concepts of material balances. Topics that will be covered include the strategy for solving problems with and without chemical reactions. Identify the limiting and excess reactants in stoichiometric equations. Employ some concepts such as (orsat analysis, dry basis, wet basis, theoretical air and excess air), in combustion problems. Understand in a general sense how material balances in industry process include recycle, bypass and purge streams.
	Learning and Teaching Strategies
	استراتيجيات التعلم والتعليم
Strategies	The effective strategies of teaching this subject are rewarding professional careers by skillfully leveraging chemical engineering principles. To achieve these broad objectives, the curse provides the knowledge, skills and professional development concepts of lecturers, tutorials and seminars.

	Material Covered
Week 1	 Write and balance chemical reaction equations. Determine the stoichiometric quantities of reactants and products. Define excess and limiting reactant
Week 2	Understand terminology of conversion, degree of completion, selectivity, yield,
Week 3	- Identify the extent of a reaction in a reaction, and calculate the fraction or percent excess reactant, percent conversion and the yield.
Week 4	-Apply 10-step strategy to solve problems with chemical reactions
Week 5	-Formulate and solve material balances using species balances
Week 6	-Formulate and solve material balances using element balances
Week 7	Midterm exam
Week 8	Material Balances Involving Combustion.
Week 9	Understand the meanings of stack gas, flue gas, Orsat analysis, dry basis, wet basis, theoretical air and excess air.
Week 10	Material balances for multiple units with reaction occurs
Week 11	-Industrial application of material balance -Recycle without Chemical Reaction
Week 12	-Utilize terminology extent of reaction, overall conversion and single pass conversion in solving recycle problems involving reactors.
Week 13	Explain the purpose and Calculations of a bypass stream
Week 14	Explain the purpose and Calculations of a purge stream
Week 15	Case study material balances in industry.

Module Aims أهداف المادة الدر اسية	By teaching energy balance in chemical enginee knowledge and skills to analyze and optimize processes, which is essential for a sustainable and field of chemical engineering.	e energy use ir	chemical
Module Learning Outcomes مخرجات التعلم للمادة الدراسية	 Understanding the Multi-phase equilibrium. An ability to define heat, work, energy, enthalged. An ability to make estimations of heat capacity changes for systems without and with phase of the steam tables. An ability to use the steam tables. An ability to solve energy balances for closed and chemical reaction) at steady and unsteady moto. An ability to solve energy balances for systems. An ability to solve simple combined mate (systems without and with chemical reaction). An ability to use the humidity chart, det dissolution, and mixing. 	y and to calculate changes. and open system des. s with chemical and energy	reaction. balances
Indicative Contents المحتويات الإرشادية	Indicative content includes the following.Undergraduate Review (4 hrs)		

	 Understanding the Multi-phase equilibrium (6 hrs).
	Fundamentals of Energy Balance (6 hrs)
	Estimation of enthalpy of vaporization, latent heat,
	 Energy Balance for non-reactive systems (20 hrs)
	 Energy Balance for reactive systems (20 hrs)
	 Integrated Material and energy balance (6 hrs)
	Case study (6 hrs).
Course Description	This course introduces students to the fundamental principles and applications of energy balance in chemical engineering. It focuses on the analysis and quantification of energy flows within chemical processes and the optimization of energy usage for improved efficiency and sustainability. Through lectures, problem-solving exercises, and laboratory work, students develop a comprehensive understanding of energy conservation, heat transfer mechanisms, and the application of energy balance equations.
	Learning and Teaching Strategies
	استر اتيجيات التعلم والتعليم
	Begin to establish a strong conceptual understanding of the principles of
	energy balance. Use real-life examples and measurements to help students
	relate abstract concepts to everyday experiences. Encourage discussions
Stratogics	and questions to clear up any misconceptions. In addition, provide students
Strategies	with real-world problem scenarios that require the application of energy
	balance principles. Encourage active participation and group discussions to
	enhance critical thinking and problem-solving skills. Guide students through
	the problem-solving process and provide constructive feedback.

Prerequisite module	MASS BALANCE (CHEM_ENG 202)	Semester	1,2						
Co-requisites module	ENERGY BALANCE (CHEM_ENG 201)	Semester	1,2						
	Module Aims, Learning Outcomes, Indicative Contents and Brief Description أهداف المادة الدر اسية ونتائج التعلم والمحتويات الإرشادية مع وصف مختصر								
Module Aims أهداف المادة الدر اسية	 To understand the basic concept of fluid for vapor pressure, cavitation and Newton laws. To get acquainted the pressure due to fluid devices used to estimate this pressure such manometer, piezometer, u-tube manometer manometer, mechanical gauge. To understand mass and volume flow rate equations. To develop problem solving Bernoulli's expected by profile. To know how measure the flow by using words and nozzle. To accommodate the flow pattern, velocited turbulent flow. To get acquainted the static, kinematic and minimals. To understand energy losses and pressure pipe flow. To fathom the fitting used in the pipes. To distinguish between the major and minimals. 	w of viscosity d. Also, the mea ch as, manometer er, differential e, continuity and q and its applicat venturi, orifice, p y profile in lamin d dynamic fluids e drop in pipe an	surement r, simple energy ion. itot tube, nar and						
Module Learning Outcomes مخرجات التعلم للمادة الدراسية	 After successful completion of the module, str. Explain the concept of continuum descrip description of fluids in terms of field, and streamlines and path line Describe in mathematical terms the main pressure, viscous, friction, and gravity for Definition and applications of Newton's laterated terms the laminar and turbulent flow in Recognize all the flow measurements Solve some basic static and dynamics fluid Explain and use equation of continuity, coand conservation of energy, and able to enconservation laws for a control volume stream system. Explain the physical meaning and assump equation and able to solve some basic fluid Derive the differential equation for internable to solve it to obtain the velocity profit 	tion of matter an related concepts forces in fluids, sees w of the viscosit pipe d nservation of monploy them to dearing from those tion of the Berned flow problems al flow problems	omentum erive the for a

	4. Industrial gases	(6hr)				
	5. Introduction to petrochemical processes	(4hr)				
	6. Petrochemical industries	(12hr)				
	7. Biogas industries	(4 hrs)				
Course Description	 Biogas industries This course considers processing of raw materials into us profitable products. These products are used both as consumand as intermediates for further chemical and physical mode to yield consumer products. This course considers the functional area in which engineers are employed in different industrial fields (promaintenance, quality control, process, design, admin research, development, consulting, others) Getting to know the industries that produce petroleum, how production processes in the factories? How to control the production process. The study of how into between substances and compounds take place. The 					
	pressure and temperature on the petrochemical industries Learning and Teaching Strategies استر اتیجیات التعلم و التعلیم					
	The learning and teaching strategy is designed to: Carefully					
	lectures the necessary fundamental material and analytical technical	-				
Strategies	demonstrate concepts with appropriate (and where possible practical)					
	examples Allow students adequate time to practice the techniques using a					
	large number of carefully selected tutorial problems.

	Material Covered
Week 1	Introduction to chemical process design
Week 2	Flowsheets -Design Information
Week 3	Process creation, Process Structure - basic process operations, process operating conditions
Week 4	Sulphur and sulphuric acid/ Chlor-alkali industries
Week 5	Nitrogen industries: ammonia / Fertilizer industries, Nitric acid
Week 6	Cement, lime, gypsum / Glass industries
Week 7	Midterm exam
Week 8	Industrial gases: carbon dioxide / Hydrogen / Nitrogen & oxygen
Week 9	Vegetable oils and animal fats and oils / soaps and detergents
Week 10	Introduction to petrochemical processes
Week 11	Methanol from Synthesis gas route
Week 12	Formaldehyde from Methanol
Week 13	Vinyl chloride from ethylene using two step process
Week 14	Ethylene and acetylene production
Week 15	Styrene from Benzene, DDT manufacture from Benzene
Week 16	Final Exam

	5. Demonstrate an understanding of string	manipulation and	d regular					

	expressions in Python.
	6. Demonstrate an understanding of how to deal with files and
	-
	exceptions.
	Introduction to Python: syntax, data types, and control structures.
	 Condition Statements: if, elif, and else statements.
	 Iteration Statements: for and while loops.
	 Functions: defining functions and parameter passing.
Indicative Contents	Lists: creation, indexing, and slicing.
	Tuples: creation and unpacking.
المحتويات الإرشادية	Dictionaries: creation and manipulation.
	Sets: creation and manipulation.
	 Strings: creation, manipulation, and regular expressions.
	 Files: creation, saving and manipulation.
Course Description	This module introduces students to the Python programming language, its syntax, and its use in solving programming problems. The module covers the basic programming concepts of condition statements and iteration statements, along with the design and implementation of functions. The module also covers the basic data structures of Python, including lists, tuples, dictionaries, and sets. The module concludes with an introduction to string manipulation and regular expressions in Python.
	Learning and Teaching Strategies استراتیجیات التعلم والتعلیم
	The module will be delivered through a combination of lectures, assignments, quizzes,
	and lab sessions. Lectures will provide an overview of the topics, while assignments and
	quizzes will enable students to apply their knowledge and check their understanding.
Strategies	Lab sessions will provide hands-on experience with Python programming tools and
	techniques. The module will also include self-directed learning, where students are
	expected to read and research on their own to enhance their understanding of the
	subject matter.

أهداف المادة الدر اسية ونتائج التعلم والمحتويات الإرشادية مع وصف مختصر									
Module Aims أهداف المادة الدر اسية	 To understand pumping in liquids, types of pumps To understand the calculation of energy needed to pump liquid in the pipe system To knowledge about dimensional analysis Simplify the Dimensional analysis and the dimensionless group To get acquainted the basic concept of the boundary layer To get acquainted the compressible fluid, isothermal and adiabatic flow To understand the compressor and the energy required to compress the fluids To explain the mixing of liquids To comprehend the flow in presence of solid particle 								
Module Learning Outcomes مخرجات التعلم للمادة الدر اسية	 After successful completion of the module, str. Identifying the types of pumps and homogrelations. be able to evaluate the operating points for pumps connected in series or in parallel. Understand the concept of vorticity and reflow. Explain the compressible fluids and comp. Learn about mixers, their types and extentypes. Definition of the boundary layer. Ability to derive the terminal settling velo. Interpret experimental and test results and appropriate engineering report format. Collaborate with others in a team project energineering investigations and produce engineering investigations. 	genous centrifugor different systemational and irressors to fuse Vortex a city, including the present these in a convironment to co	ral pump oms using otational and their heir forces an						
Indicative Contents المحتويات الإرشادية	Indicative content includes the following. Dimensional Analysis Boundary layer Pumping of liquid, types of pump, system heads, [15 Hrs.] operation characteristics, centrifugal pump relaparallel Flow of compressible fluid, [15 Hrs.] isothermal and adiabatic flow, compressor and complexity of liquid, power curve, Flow in presence of [15 Hrs.]	ompressing of ga	s, [15 Hrs.]						
Course Description	The course begins with fluid flow applied to a ran engineering, including dimensional analysis calculation of the energy required to pumping the	, Pumps, pun	ips types,						

compressible fluids, compressor, mixing and their ranges of application, flow in the presence solid particle

Students will work to formulate the models necessary to study, analyses, and design fluid systems through the application of these concepts, and to develop the problem-solving skills essential to good engineering practice of fluid mechanics in practical applications.

Learning and Teaching Strategies

استراتيجيات التعلم والتعليم

The main strategy that will be adopted in delivering this module is

- encourage students' participation in the exercises,
- refining and expanding their critical thinking skills. This will be achieved through classes, interactive tutorials.
- by considering type of simple experiments involving some sampling activities that are interesting to the students.
- Developing students' abilities in research by asking students to group discussion sessions
- urging students to look at sources, books and the Internet as a source of information in addition to homework

Module Aims, Lea	arning Outcomes, Indicative Contents and Brie	ef Descript	ion			
ختصر	داف المادة الدر اسية ونتائج التعلم والمحتويات الإرشادية مع وصف ه	أه				
Module Aims أهداف المادة الدر اسية	Understand the need for numerical methods, and go through the stages (mathematical modeling, solving and implementation) of solving a particular physical problem. Understand the basics of differentiation, relate the slopes of the secant line and tangent line to the derivative of a function, use rules of differentiation to differentiate functions, find maxima and minima of a function, and apply concepts of differentiation to real world problems. Use several minimizing of residual criteria to choose the right criterion, derive the constants of a linear regression model based on least squares method criterion, use in examples, the derived formulas for the constants of a linear regression model, and prove that the constants of the linear regression model are unique and correspond to a minimum. Define an ordinary differential equation, differentiate between an ordinary and partial differential equation, and solve linear ordinary differential equations with fixed constants by using classical solution and Laplace transform techniques.					
Module Learning Outcomes مخرجات التعلم للمادة الدر اسية	 Demonstrate understanding of common numerical methey are used to obtain approximate solutions to othe mathematical problems. Apply numerical methods to obtain approximate solutions mathematical problems. Derive numerical methods for various mathematical tasks, such as interpolation, differentiation, integrat linear and nonlinear equations, and the solution of a equations. Analyze and evaluate the accuracy of common nume. Implement numerical methods in Matlab, Comsol and Write efficient, well-documented Matlab code and Expresent numerical results in an informative way. Recognize when numerical methods can be employed in mathematics. Apply numerical methods in solving systems of linear Solve initial-value problems in ordinary differential eigenvalues and eigenvectors. 	erwise intract utions to operations a ion, the soluti lifferential crical methods ad Excel excel sheet and d to solve pro	table nd on of s. blems			
Indicative Contents المحتويات الإرشادية	Indicative content includes the following. • Errors, Approximations and Series Approach (2 h • Roots Estimation, fundamentals and its application • System of equation (Linear and non-linear) (4 hrs.) • Integration, differentiation and Interpolation (6 h • Regression (linear, multilinear and non-linear) (4	on (4 hrs.) s.) ars.)				

Course Description	To explore complex systems, physicists, engineers, financiers and mathematicians require computational methods since mathematical models are only rarely solvable algebraically. Numerical methods, based upon sound computational mathematics, are the basic algorithms underpinning computer predictions in modern systems science. Such methods include techniques for simple optimization, interpolation from the known to the unknown, linear algebra underlying systems of equations, ordinary differential equations to simulate systems, and stochastic simulation under random influences. Topics covered are: the mathematical and computational foundations of the numerical approximation and solution of scientific problems; simple; vectorization; clustering; polynomial and spline interpolation; regression; pattern recognition; integration and differentiation; solution of large scale systems of linear and nonlinear equations; modelling and solution with sparse equations; explicit schemes to solve ordinary differential equations and partial differential equations.

	Module Aims, Learning Outcomes, Indicative Contents and Brief Description أهداف المادة الدر اسية ونتائج التعلم والمحتويات الإرشادية مع وصف مختصر						
Module Aims أهداف المادة الدر اسية	Enable students to develop a comprehensive understanding of the heat ransfer mechanisms through the bodies and thermal systems, heat transfer methods, thermal resistance, selection criteria thermal insulations, and heat ransfer in unsteady-state condition.						
Module Learning Outcomes مخرجات التعلم للمادة الدراسية	 Identify the heat transfer method through the system. Identify the type of the thermal resistance and its imtransfer rate. Find appropriate solutions for the system contain generation. Specify critical thickness of insulation that covered cylindrical solutions for determination distribution in semi-infinite bodies at unsteady-state of the system. 	npact on the ns internal linders and of tempera	heat pipe.				
Indicative Contents المحتويات الإرشادية	 Indicative content includes the following. Heat transfer methods Steady-state conduction one-dimension Steady-state conduction two-dimension Unsteady-state conduction (16 hrs) (16 hrs) 						
Course Description	This course is aimed to establish fundamental knowledge of heat transfer. Presentation of the course starts by introducing the heat transfer method and then utilizes it to solve problems in steady-state conduction, with and without heat generation, in three geometries: plane wall, cylinder and sphere. The thermal resistance calculation in these geometries is presented. In addition, the temperature prediction in semi-infinite bodies at unsteady-state conditions is discussed.						
	Learning and Teaching Strategies استراتیجیات التعلم والتعلیم						
The learning and teaching strategy can be achieved through: focusing on the principle of the module subjects, explain the theoretical material through practical applications, solving adequate number of problems (tutorial and homework) and evaluate the student learning by conducting exams.

Module Aims أهداف المادة الدر اسية	The overall goal of this course is to enable students to formulate mathematical models of chemical engineering systems, apply analytical methods and computer programs to calculate solutions, estimate its behavior and make predictions about behavior of these systems. The focus of the course will be on studying and applying various modeling techniques						
Module Learning Outcomes مخرجات التعلم للمادة الدراسية	to creating mathematical description of the chemical engineering systems. 1. Handle freely the basic chemical engineering principles using in mathematical modeling. 2. Analyze a simple transport phenomena in order to create a mathematical model. 3. Apply basic principles to model the chemical engineering systems in a form of differential equations or difference equations. 4. Interpret the results in order to predict the behavior of the chemical engineering systems 5. Understand the mechanism of mathematical modeling in chemical engineering						
Indicative Contents المحتويات الإرشادية	Indicative content includes the following. • Lumped models (4 hrs) • Distributed Models (4 hrs) • Finite Difference Models (4 hrs) • Modeling Applications (6 hrs) • Computer-Aided Modeling (4 hrs)						
Course Description	• Treatment of Experimental Results (4 hrs) This course is offered to undergraduates and introduces students to the mathematical modeling and applied mathematics. It necessitates both a sound understanding of the chemical engineering fundamentals and a quite sophisticated engineering analysis. It also requires a computer program to solve problems that are not tractable by hand.

Module Aims, Learning Outcomes, Indicative Contents and Brief Description						
أهداف المادة الدراسية ونتائج التعلم والمحتويات الإرشادية مع وصف مختصر						
Module Aims أهداف المادة الدر اسية	The module aims to provide students with a solid understanding of the principles and applications of thermodynamics, enabling them to apply these concepts to solve problems and analyze various systems and processes.					
Module Learning Outcomes مخرجات التعلم للمادة الدراسية	 Understand the concepts of thermodynamics, heat and work. Identify the application and characteristics the first law of thermodynamics, Joule's experiment. Internal energy, Enthalpy. Steady-State steady-flow processes. Develop Equilibrium and the phase rule. Reversible processes. Processes at constant volume and constant pressure. Heat capacities. Able to apply volumetric properties of pure fluid,: PV- T diagrams. Ideal gas. Virial equation and its applications. Cubic equations of state. Generalized correlations for gases and liquids. Identify the application and characteristics second law of thermodynamics: Statement of the second law. Heat engines. Carnot cycle. Thermodynamic scale of temperatures. Entropy. The third law of thermodynamics. 					
Indicative Contents المحتويات الإرشادية	 Undergraduate review (4 hr). Introduction to thermodynamics (4 hr). Basic concepts and definitions (system, surroundings, boundary, state, equilibrium, etc.) (4 hr). Laws of thermodynamics (First law of thermodynamics (conservation of energy), Second law of thermodynamics (entropy and energy transfer), Third law of thermodynamics and absolute zero. (18 hr). Properties of pure substances: Properties of substances and equations of state Phase diagrams and phase transitions, Ideal gas law and real gas behavior. (12 hr). Energy and heat transfer: Forms of energy (internal energy, potential energy, kinetic energy, Heat, work, and energy transfer mechanisms Heat capacity and specific heat. (14 hr). 					
Course Description	In this course, students learn some details of present the laws of thermodynamics, showing their application to the study of thermal effects in chemical processes and the analysis of power cycles. Study and evaluate the thermodynamic properties of pure fluids. Principal To impart the detail concepts of thermodynamics and so on.					
Learning and Teaching Strategies استراتیجیات التعلم و التعلیم						
Strategies	Employ various strategies to enhance student understanding and engagement with the subject matter. Here are some effective strategies for teaching thermodynamics such as: Conceptual Understanding, Active Learning, Visualization Tools, Practical Applications, Problem-Solving Approach, and Real-World Examples.

Module Aims, Lea	arning Outcomes, Indicative Contents an	d Brief Descr	iption					
أهداف المادة الدر اسية ونتائج التعلم والمحتويات الإرشادية مع وصف مختصر								
Module Aims أهداف المادة الدر اسية	The aim of this module is to give the participants an understanding of separation process technology currently used in the modern chemical industry. This module gives an overview of the technology and design methods for four industrially important separation techniques: distillation, liquid-liquid extraction, evaporation, and drying-based processes.							
Module Learning Outcomes مخرجات التعلم للمادة الدر اسية	 mixtures. Predict equilibria for binary vapor-liqu appropriate graphical representations of t Design stage processes for binary extraction, evaporation, and drying using and tie lines. Recall the methods used to separate musystems by distillation. Recall the short-cut methods used for mul Develop critical understanding of exseparation processes and their fit for pu 	 Recognize models used to describe phase equilibrium in ideal mixtures. Predict equilibria for binary vapor-liquid systems and interpret appropriate graphical representations of these equilibria. Design stage processes for binary distillation, liquid-liquid extraction, evaporation, and drying using equilibria, operating lines and tie lines. Recall the methods used to separate multi feeds and stream sides systems by distillation. Recall the short-cut methods used for multi-component distillation. Develop critical understanding of emerging technologies in separation processes and their fit for purpose and limitations and understand how to combine and adapt different aspects of systems 						
Indicative Contents المحتويات الإرشادية	Indicative content includes the following. • Distillation (28 hrs) • Liquid-liquid extraction (12 hrs) • evaporation (8 hrs) • Drying (8 hrs)							
Course Description	This course provides an introduction to separation processes in general, but with particular emphasis on equilibrium staged separations of binary mixtures. Processes covered include binary distillation, liquid-liquid extraction, evaporation and drying.

Module Aims, Learning Outcomes, Indicative Contents and Brief Description								
ختصر	أهداف المادة الدراسية ونتائج التعلم والمحتويات الإرشادية مع وصف مختصر							
Module Aims أهداف المادة الدر اسية	This module aims to provide chemical engineering students with a thorough understanding of a number of separation processes that are essential to the process industry, such as sedimentation, filtration, Screening, Fluidization and Centrifugation processes.							
Module Learning Outcomes مخرجات التعلم للمادة الدراسية	 After completing this module successfully, the student will be able to: Gain the knowledge and abilities necessary to apply theory, experimentation, data analysis, and interpretation into unit operations. Students are learned the basic principles in separation engineering such as (Filtration, fluidization, sieving, sedimentation etc). Student understands the principles of Packed Column analysis and design. Develop the ability to understand Sedimentation processes including gravity settling, sink-and-float methods, and differential settling methods, uses of clarifiers and thickeners, flocculation, and batch sedimentation; Understand how to evaluate the size reduction for solid particles. Know the properties of masses of particulate solids. The screen effectiveness as a measure of a screen's success in separating solid particles. Know the properties of fluidization technology, characteristics of fluidized systems; mass and heat transfer between fluids and particles; liquid-solids and gas-solids systems. Describe the filtration separation method. Mechanism that controls how fluids move through porous beds. The various forms of industrial filtration and the filter medium. Understand the centrifugal design and analysis. 							
Indicative Contents المحتويات الإرشادية	Indicative content includes the following. Packed columns (4hrs) Sedimentation and settling (4 hrs) solid particles and Screening process (4 hrs) Fluidization (4 hrs) Filtration process (8 hrs) Centrifugation process (4 hrs)							
Course Description	In this course, the aim is to provide students with a basic knowledge of separation processes in unit operations, which is important for understanding the structure, operation, and design of chemical reactions, Learn the diluted and concentrated slurry in sedimentation systems and properties of filtration methods including cake filters, discontinuous pressure filters, filter presses, continuous vacuum filters, rotary drum filters,							

characteristics of fluidized, liquid-solids, and gas-solids systems; and applications centrifugation processes.

Learning and Teaching Strategies

استراتيجيات التعلم والتعليم

Strategies

This module covers a variety of theoretical, conceptual and practical areas, which require a range of knowledge and skills at a more advanced level to be displayed and exercised. Delivery of its syllabus content therefore involves a diversity of teaching and assessment methods suitable to the learning outcomes of the module; these include formal lectures, structured tutorials (work closely integrated with the lecture material), laboratory exercises to develop practical skills and familiarization with equipment and experimental techniques.

Module Aims, Learning Outcomes, Indicative Contents and Brief Description				
ختصر	أهداف المادة الدراسية ونتائج التعلم والمحتويات الإرشادية مع وصف م			
	Enable students to develop different mathematical models based on			
	the equations of material and/or energy conservation.			
Module Aims	Enable students to solve different theoretical models of chemical			
أهداف المادة الدر اسية	processes.			
	• Understand the dynamic behavior difference between 1st and 2nd			
	order systems			
	Understand the difference between SISO and MIMO processes			
	1- Formulate and solve mathematical dynamic ODE models of chemical			
	processes 2- Formulate Transfer Function models for different systems			
	3- Linearize of Non-Linear Models			
Module Learning	4- Recognize the dynamic response of 1st order, integrating and 2nd order			
Outcomes	systems to different forcing functions			
مخرجات التعلم للمادة الدراسية	5- Understand the effect of poles, zeros and time delays on the dynamic			
	response of complex systems			
	6- Approximate complex (higher order) TF models to simple models			
	7- Formulate State-Space and Transfer Function Matrix models for			
	MIMO systems			
	Indicative content includes the following: • Fundamentals of Mathematical ODE models (10 hr)			
	Fundamentals of Laplace Transforms Technique (10 hr)			
Indicative Contents	Fundamentals of TF Models (10 hr)			
المحتويات الإرشادية	 Dynamic response of simple (1st and 2nd) models (10 hr) 			
	Dynamic response of complex (higher order) models (10 hr) Figure 1 and 1			
	 Fundamentals of State-Space and TF Matrix models for MIMO systems (10 hr) 			
	This course aims to establish fundamental knowledge of process dynamics			
	and control. It starts by introducing the mathematical ODE models of			
Course Description	chemical processes followed by explaining the ODE solution method (Laplace Transforms). Transfer Function models and their dynamic response for			
	simple and complex models are discussed in this course. Finally, State-Space			
	and TF Matrix models for MIMO systems are focused in this course.			
	Learning and Teaching Strategies			
	استراتيجيات التعلم والتعليم			
	The learning and teaching strategy is designed to: Carefully cover in lectures			
G	the necessary fundamental material and analytical techniques, and			
Strategies	demonstrate concepts with appropriate (and where possible practical)			
	examples Allow students adequate time to practice the techniques using a large number of carefully selected tutorial problems.			
	large number of carefully selected futorial problems.

Module Aims أهداف المادة الدر اسية						
Module Learning Outcomes مخرجات التعلم للمادة الدراسية	 Understand the fundamental concepts of corrosion: electrochemical kinetics and thermodynamics. Identify and recognize the common forms of corrosion such as general corrosion, pitting corrosion, stress corrosion and hydrogen embrittlement. Understand the concept of passivity. Understand various techniques of corrosion measurements Select corrosion resistant materials for a given application. Select technique for corrosion prevention. 					
Indicative Contents المحتويات الإرشادية	Indicative content includes the following - Introduction about corrosion and electrochemical. (4hrs.) - Electrochemical thermodynamics and kinetics. (12hrs.) - Passivity, pitting and crevice corrosion. (8 hrs.) - Environmental factors that cause corrosion and cracking (8 hrs.) - Atmospheric corrosion. Control or prevention the corrosion and the Inhibitors. (12 hrs.) - Coating and Material selection. (12 hrs.)					
Course Description Course

Delivery Plan (Weekly Syllabus) Identification Material Covered Week 1 Basic concepts: Definition and importance, Electrochemical nature and forms of corrosion, Corrosion rate and its determination. Week 2 Basic concepts: Definition and importance, Electrochemical nature and forms of corrosion, Corrosion rate and its determination. Belectrochemical thermodynamics and kinetics: Electrode potentials, Potential-pH (Pourbiax) diagrams, Reference electrodes and experimental measurements, Faraday's laws, Instrumentation and experimental procedure. Week 3 Galvanic and concentration cell corrosion: Basic concepts, Experimental measurements, and

	determination of rates of galvanic corrosion, Concentration cells.
Week 4	Corrosion measurement through polarization techniques: Tafel extrapolation plots, Polarization resistance method, Commercial corrosion probes, Other methods of determining polarization curves.
Week 5	Passivity: Basic concepts of passivity, Properties of passive films, Experimental measurement, Applications of Potentiostatic Anodic Polarization, Anodic protection
Week 6	Pitting and crevice corrosion: Mechanisms of pitting and crevice corrosion, Secondary forms of crevice corrosion, Localized pitting, Metallurgical features and corrosion: Intergranular corrosion, Weldment corrosion, De-alloying and dezincification
Week 7	Midterm exam
Week 8	Environmental induced cracking: Stress corrosion cracking, Corrosion fatigue cracking, Hydrogen induced cracking, Methods of prevention and testing, Erosion, Fretting and Wear.
Week 9	Environmental factors and corrosion: Corrosion in water and aqueous solutions, Corrosion in sulphur bearing solutions, Microbiologically induced corrosion, Corrosion in acidic and alkaline process streams
Week 10	Atmospheric and elevated temperature corrosion: Atmospheric corrosion and its prevention, Oxidation at elevated temperatures, Alloying, Oxidizing environments
Week 11	Prevention and control of corrosion: Cathodic protection
Week 12	Inhibitors
Week 13	Coatings including metals, oxides and polymers and take a look at the mechanisms of corrosion at the metal/oxide /polymer interface for painted materials.
Week 14	Material selection and design
Week 15	Material selection and design, Contn'd
Week 16	Final Exam

	8. Experimentally test and evaluate the main properties of crude oil and oil fractions.			
Indicative Contents المحتويات الإرشادية	Indicative content includes the following. Classification of Crude Oils, Composition of Crude Oils (6 hrs) Physical and Chemical Properties of Crude oil and Oil Products (9 hrs) Evaluation of Crude Oils (9 hrs) Crude Oil Pre-treatment and Fractionation of Crude Oil (6 hrs) Yield Estimation of Crude Oil (3 hrs) Thermal Cracking and Coking Processes (9 hrs)			
Course Description	This course presents a comprehensive introduction to petroleum refining technology and calculations. The focus is on transportation fuels refineries. The program includes an overview classification of crude oils, composition of crude oils, physical and chemical properties of crude oil and oil products, evaluation of crude oils, crude oil pre-treatment, fractionation of crude oil (Atmospheric and Vacuum Distillation, Light End Fractionation, Process Description) and thermal cracking and coking processes.			
	Learning and Teaching Strategies استراتيجيات التعلم والتعليم			
Strategies	The learning and teaching strategy is designed to cover the necessary fundamental knowledge and analysis of upstream operations in the petroleum refining industries and the necessary fundamental material and analytical techniques related to refining processes. Also, allow students to consolidate and apply understanding practice the techniques based on a large number of carefully real-world problem scenarios, which require the application of the fundamental of petroleum refining principles.

Course Description

In this course, basic methods in the synthesis of polymers are addressed and discussed, including the various types of polymerizations and their applications toward both common and new promising polymer products. This class presents the most common synthetic methods used in polymerization, the basic differences in the kinetics of these methods, the final end-products obtained, and the synthetic processing techniques that might be used for various applications.

Learning and Teaching Strategies

استراتيجيات التعلم والتعليم

Strategies

The learning and teaching **strategy** is designed to: Carefully describe the course design and teaching methodology for polymer chemistry and applications lecture class specifically aimed at small college and university instruction. This intermediate course for undergraduates a students focuses on teaching the basics of polymer history, synthesis, and characterization with connections to the core chemistry curriculum. Furthermore, an extensive overview of the applications of polymeric materials gives students a connection to real-life applications. The course includes polymer case studies, informational lessons on real-world objects made of polymers, and demonstrations. Student presentations on how polymers are important to society help connect the course to the world around them. The course is designed to instill the knowledge necessary for students to be successful in a career in polymers.

	Delivery Plan (Weekly Syllabus) المنهاج الاسبوعي النظري
	Material Covered
Week 1	Course Overview, Polymer Design and Synthesis, Reaction Types and Processes, Introduction to Step Growth
Week 2	Molecular Weight (MW) Control, Molecular Weight Distribution (MWD) in Equilibrium Step Condensation Polymerizations, Interchange Reactions: Effects on Processing and Product, Application Example: Common Polyesters
Week 3	Step Growth Polymerization, Types of Monomers, Kinetics and Equilibrium Considerations, Closed vs. Open System
Week 4	Common Processing Approaches, Near-equilibrium vs. Far from Equilibrium, Homogeneous Solution and Bulk Polymerization
Week 5	Other Polymers of Interest Obtained by Step-Growth, Polyaramids, Polyimides, Segmented and Block Copolymers from Step Condensation Methods
Week 6	Crosslinking and Branching, Network Formation and Gelation, Carothers Equation: Pn Approach
Week 7	Midterm exam
Week 8	Processing Approaches: Emulsion Polymerization Processes
Week 9	Processing Approaches: Suspension (Bead) Polymerization Processes, Polyvinyl Chloride Via Precipitation Polymerization, Polyethylene Via Radical Polymerization
Week 10	Ziegler-Natta Catalysis, Stereochemistry of Polymers, Stereoregular Polymerizations, Radical Copolymerization: Alternating to Block Copolymers
Week 11	Introduction to Anionic Polymerization, Monomers Applicable to Anionic Methods, Kinetics of "Nonliving" Anionic Polymerization
Week 12	Anionic Block Copolymerization
Week 13	Anionic Ring Opening Polymerization, End Group Functionalization, Telechelic Oligomers and Novel Architectures Using Coupling Techniques
Week 14	Introduction to Cationic Polymerization, Monomers, Kinetics, "Living" Cationic Polymerizations, Examples of Cationic Polymerization, Isobutyl Rubber Synthesis, Polyvinyl Ethers

Week 15	Polymer Functionalization: Motivations, Yield, Crystallinity, Solubility Issues
Week 16	Final Exam

Module Aims, Lea	arning Outcomes, Indicative Contents and Brief Description
ختصر	أهداف المادة الدراسية ونتائج التعلم والمحتويات الإرشادية مع وصف م
Module Aims أهداف المادة الدراسية	The context in which the world's petroleum refining industry operates will be thoroughly addressed in this course of study, emphasizing the importance of this sector to the world's financial system. Additionally, this module aims to equip students with the knowledge and abilities necessary for the exploration, development, production, and transportation of fuel oil and oil products for several petroleum processing, as well as information on the formation of hydrocarbons with respect to the petroleum refining industry, and the facilities and operations needed for these activities.
Module Learning Outcomes مخرجات التعلم للمادة الدر اسية	 At the end of this course, the student will be able to: Describe the catalytic operations including the FCC unit (process and calculations) and yield correlations. Advise how the hydrotreating and hydrocracking processes are described and operated, the roles, descriptions and calculations. Provide full details of catalytic dewaxing, catalytic reforming, coke deposition, processes technologies and calculations. Describe the isomerization and alkylation processes (process and calculations) with the performance of such operations. Knowledge about the chemical treatment of petroleum products based on several traditional methods in addition to oil products (manufacture and properties Enable for finding the best way of blending different intermediate products from the refinery in order to adjust the product characterizations. Identify the safety and environmental aspects in refining, wastes in refinery units beside estimation the fugitive emissions generated by refinery equipment.
Indicative Contents المحتويات الإرشادية	Indicative content includes the following: Catalytic Operations (Processes and calculations) - (FCC, HDC, HDT, Catalytic Reforming, Isomerization, Alkylation, Dewaxing) Chemical Treatment of Oil Products Lubricating Oils (Specifications, Production Process, Calculations) (6 hrs) Solvent Refining processing Oil Products and product bending Safety and Environmental Aspects in Refining (3 hrs)
Course Description	This course presents a comprehensive introduction to petroleum refining technology and calculations. The focus is on transportation fuels refineries. The program includes overview catalytic operations, fluid catalytic cracking, hydrocracking, hydrotreating, catalytic reforming, isomerization, alkylation and catalytic dewaxing). Also, describing the lubricating oils (specifications, production process and calculations), solvent refining processes and oil products productions with the main properties and specifications and operations, and product blending. Finally, this course will take into accounts the safety and environmental aspects in refining industries.

Learning and Teaching Strategies

استراتيجيات التعلم والتعليم

Strategies

الحمل الدراسي الكلى للطالب خلال الفصل

The learning and teaching strategy is made to address the essential background information and analytical methods connected to upstream activities in the refined petroleum sectors as well as the essential background information and analytical methods linked to refining processes. As well as, enable students to consolidate their knowledge and put it into practice using a variety of carefully chosen practical issue scenarios that call for the use of key oil refining techniques.

ختصر	أهداف المادة الدراسية ونتائج التعلم والمحتويات الإرشادية مع وصف مختصر							
Module Aims أهداف المادة الدر اسية	context of nonisothermal reactors. Specify and size to multiple reactions systems to achieve production go	To develop strong concepts of engineering theory and design as applied in the context of nonisothermal reactors. Specify and size the most common industrial multiple reactions systems to achieve production goals for processes involving homogeneous or heterogeneous reaction systems with a focus on reduction of accidents and incidents by inherently safe design of the reactors						
Module Learning Outcomes مخرجات التعلم للمادة الدراسية	 Demonstrate competence in the fundamental concepts of chemical non isothermal reaction engineering for single and multiple reactions. Apply these concepts for the design and analysis of industrial reactors. Design and analyze chemical reactors under steady state and transient operations. Utilization of engineering softwares such as Polymath, Matlab, and COMSOL in problem solving and optimization. 							
Indicative Contents المحتويات الإرشادية	 Adiabatic operation of reactors (8 hrs) Nonisothermal reactor operation and design (20 hrs) Multiple reactions and reactor selection (12 hrs) Multiple steady states in CSTRs (8 hrs) Inherantly safe design of reactors (4 hrs) Case studies from current/classic literature in chemical engineering on reactor runaway (2 hrs) 							
Course Description	This course aims to establish fundamental knowledge of chemical reactor design and engineering. Presentation of the course starts by introducing the chemical reaction engineering algorithm and then utilizes it to solve problems in steady state isothermal reactors. Elementary and non elementary reactions are discussed. Catalytic reactions are also introduced.							
	Learning and Teaching Strategies استراتيجيات التعلم والتعليم

APPENDIX:

GRADING SCHEME مخطط الدرجات					
Group	Grade	التقدير	Marks (%)	Definition	
	A - Excellent	امتياز	90 - 100	Outstanding Performance	
Success Group (50 - 100)	B - Very Good	جيد جدا	80 - 89	Above average with some errors	
	C - Good	جيد	70 - 79	Sound work with notable errors	
	D - Satisfactory	متوسط	60 - 69	Fair but with major shortcomings	
	E - Sufficient	مقبول	50 - 59	Work meets minimum criteria	
Fail Group	FX – Fail	مقبول بقرار	(45-49)	More work required but credit awarded	
(0-49)	F – Fail	راسب	(0-44)	Considerable amount of work required	
Note:					

NB Decimal places above or below 0.5 will be rounded to the higher or lower full mark (for example a mark of 54.5 will be rounded to 55, whereas a mark of 54.4 will be rounded to 54. The University has a policy NOT to condone "near-pass fails" so the only adjustment to marks awarded by the original marker(s) will be the automatic rounding outlined above.
